**sixth international
hydrail conference**

Conventional Rail Traction Technologies

- **Electric Traction (1881):**

- Expensive infrastructure, Lower operating cost, renewable energy (?), regenerative braking (?)

- **DC Electric Traction**

- » 1.5kV / 3kV DC supply to railway locos.

- **AC Electric Traction**

- » Predominantly 25 kV AC supply; Regenerative **Presently most efficient mode**.
- » Upper-bound of the regenerated voltage is restricted by the catenary voltage – at higher speeds, leads to inability of the regenerated power to be fed to the grid.

Conventional Rail Traction Technologies

- **Diesel Traction (1893):**

- Oil-dependent, emissions, Flexibility of operations,
- **Diesel-electric traction**

- » Diesel engine + alternator/generator produces onboard electricity.
- » Dynamic braking possible; more effective than regenerative braking (of electric traction) - avoids wear & tear of wheels & brake- blocks
- » **Can be most easily hybridised**

- **Diesel-mechanical & diesel hydraulic traction**

- » Use mechanical or hydraulic transmission to power the wheels

1-2 July 2010 | Istanbul, Turkey

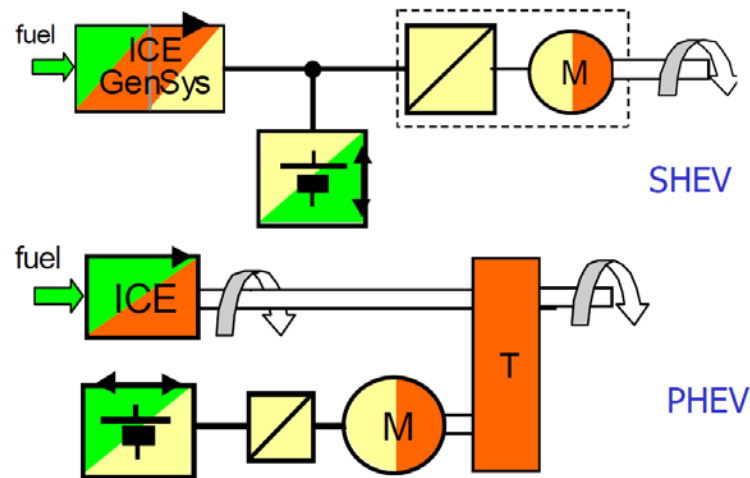

sixth international
hydrail conference

Hybrid Rail Traction

- **Hybrid** : *with more than one source of on-board power ...*
 - » ICE + batteries, ICE + batteries + supercaps,
fuel cells + batteries, fuel cells + batteries + supercaps
 - » *First used by Greeks/Romans/Vikings on oar & sail powered boats*
- Series / parallel architectures

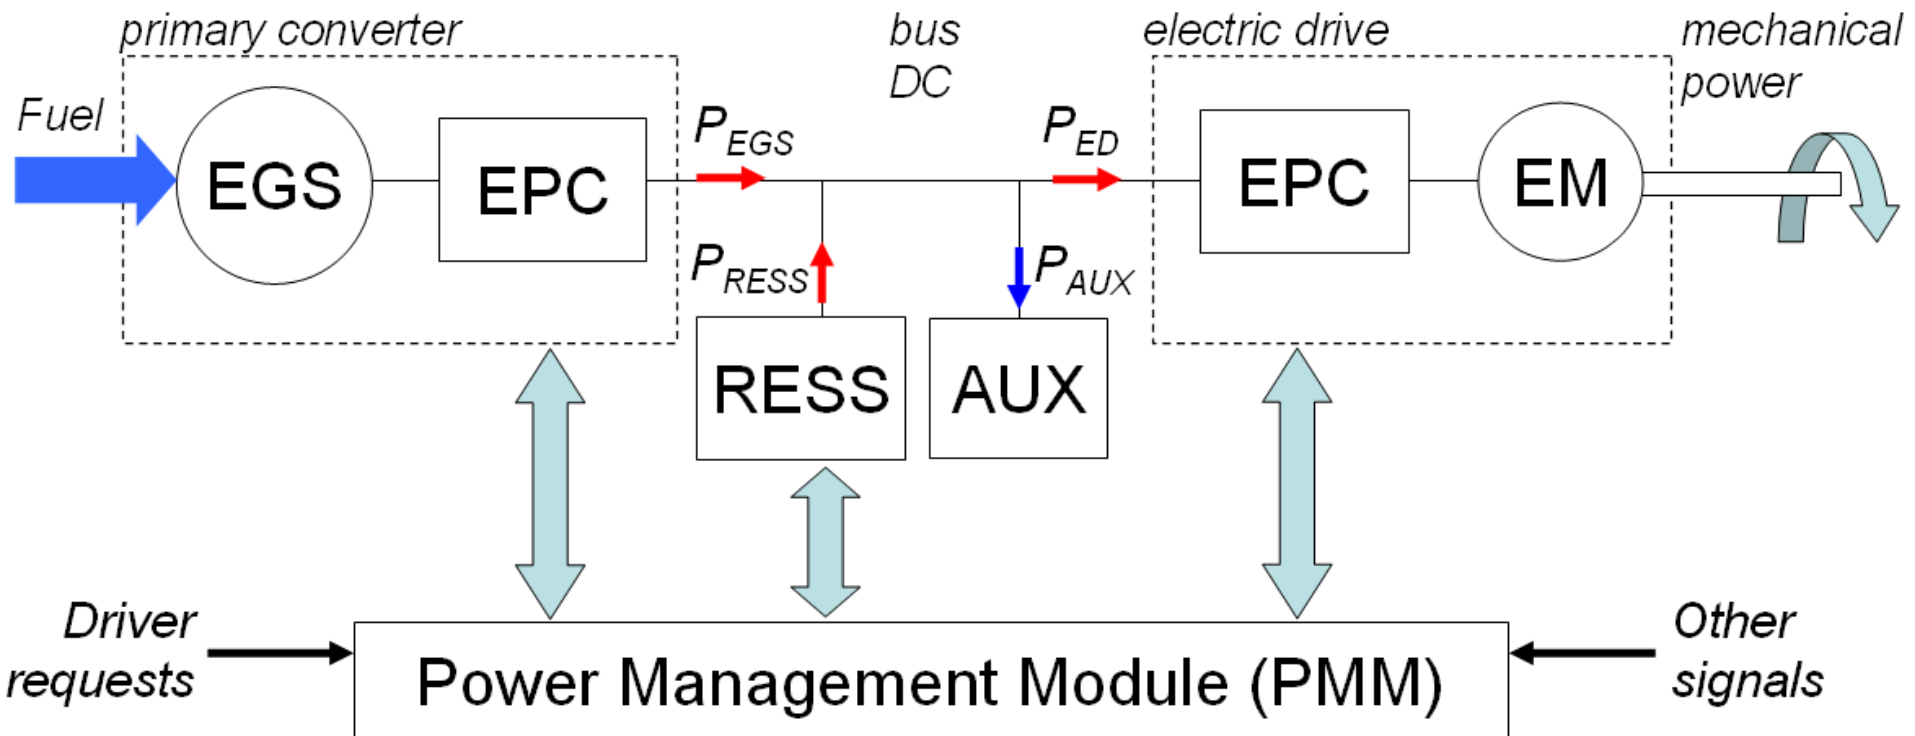

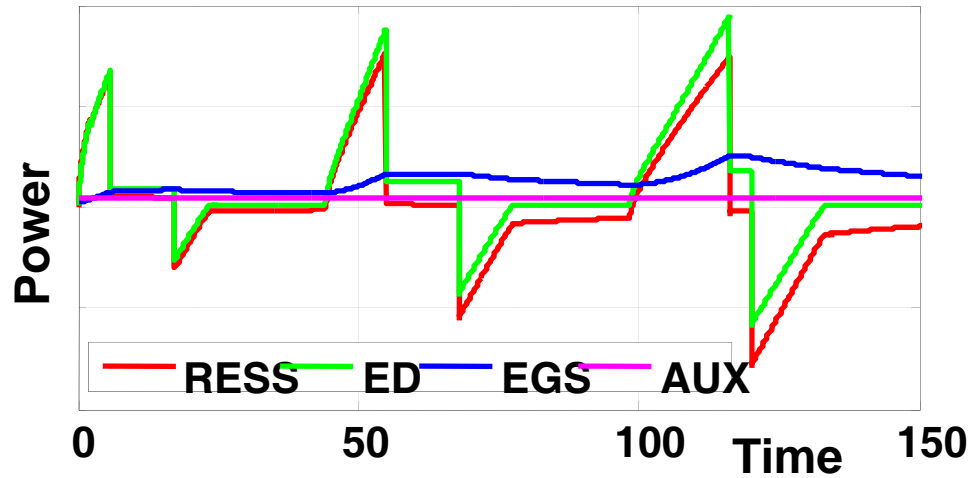

1-2 July 2010 | Istanbul, Turkey

sixth international
hydrail conference

Hybrid Traction

Key drivers for hybridisation

- Energy costs escalating rapidly
 - » Train energy consumption dependent on gradients, maximum speeds & stopping patterns
 - » Typically constitute around 15-20% of total expenses; and growing
 - » Varies 19 - 33 kWh/1000 (German ICE, MEET project)
 - » Σ lifecycle energy costs \gg original investment costs
- Reduce carbon footprint
- Economic sense

1-2 July 2010 | Istanbul, Turkey

sixth international
hydrail conference

Hybrid Rail Traction

- Advantages over conventional technologies
 - » Regenerative braking (savings: from 10 to 25%)
 - » Prime mover operates at *efficient zone* of fuel maps
 - » Energy booster for achieving higher acceleration
 - » Can be run as ZEV
- Is most advantageous when the load varies considerably e.g. passenger services
- Hybridisation degree dependent upon duty cycle
 - » Benefits from downsizing prime mover negate weight of additional components
 - » Fuel savings >> 15 - 20%, emission reduction > 50%

ENFICA-FC Project

- 1) Technical specifications/acquisition:
 - Chopper
 - Inverter
 - Motor
 - Battery
- 2) Design and realisation of AMU
- 3) Power-train integration
- 4) Lab tests:
 - Of the electricity generation system loaded with resistors
 - Of the whole power train loaded with artificial mechanical load

**Overview on Propulsion System
Power Electronics**

Economics of hybridisation: Case studies

- Scenarios
 - » Existing railway planning to switch to hybrid locos
 - » New railway, planning traction mode between electric, diesel & hybrid
- Case A
 - To determine the break-even traffic of an existing railway, planning to switch to hybrid traction
 - » electric vs. diesel vs. hybrid
- Case B
 - To determine the break-even traffic for a new railway
 - » electric vs. diesel vs. hybrid

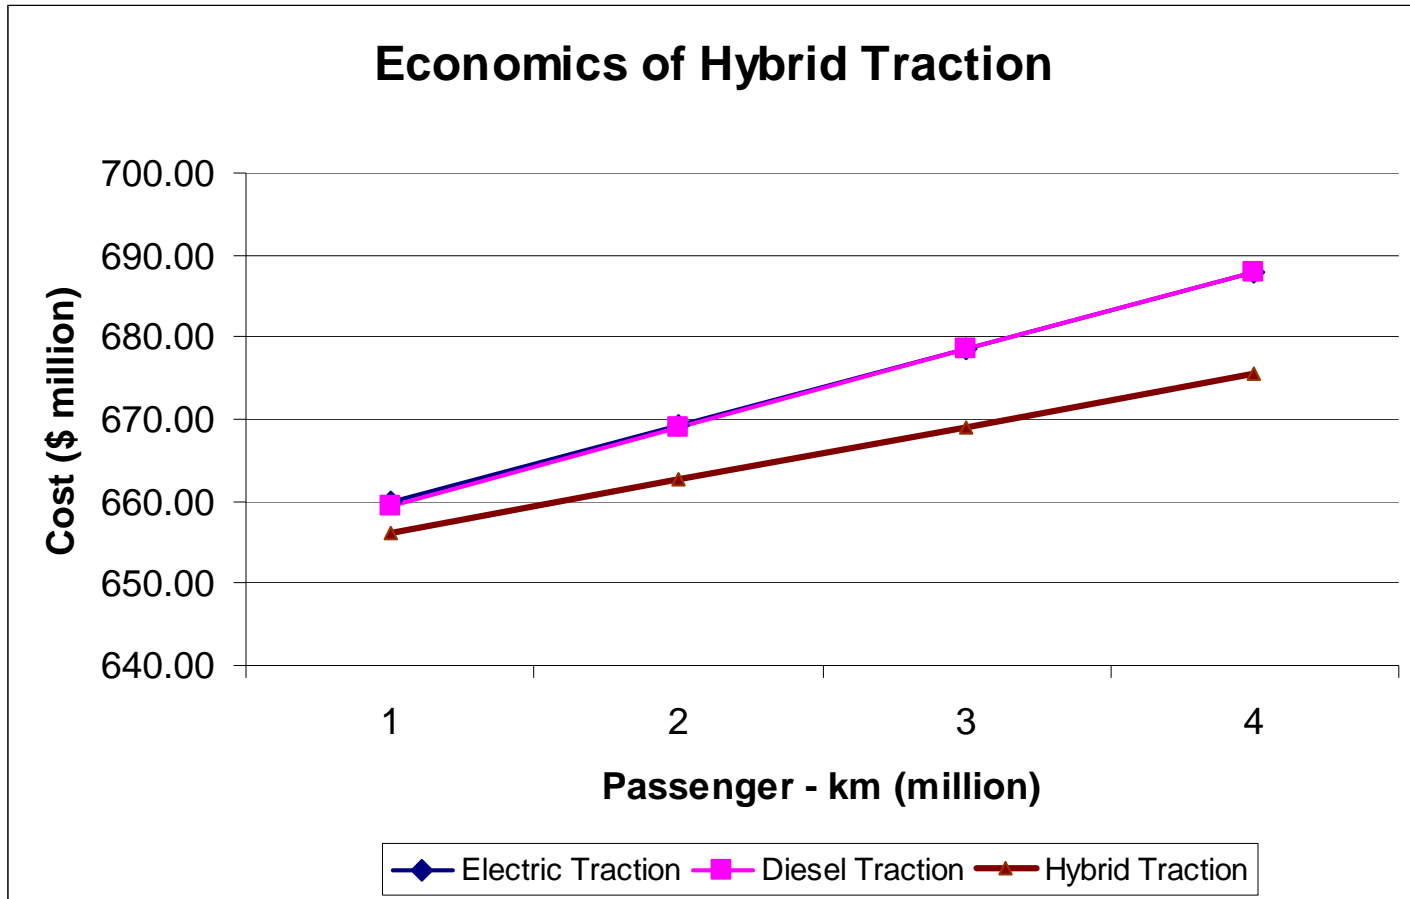

1-2 July 2010 | Istanbul, Turkey

hydrail conference

Examples of hybrid locomotives/trains

- America
 - » Rail Power (2004)
 - » GE (2008)
 - » BNSF (2009)
- Asia
 - » JR East (2007): Orders for 10 more this year
 - » RTRI (2007)
 - » JR Freight (Toshiba, 2010)
- Europe:
 - » France (Bombardier, 2007) Ten French regions ordered 144 hybrid trains
 - » UK
 - » Holland (Alstom, 2009)

1-2 July 2010 | Istanbul, Turkey

sixth international
hydrail conference

Transiting to hybrids

- Increasing number of railways are switching to hybrid powered trains
- Manufacturers
 - » Bombardier
 - » Hitachi
 - » Toshiba
 - » Mitsubishi
 - » Alstom
 - » Siemens
 - » ABB

1-2 July 2010 | Istanbul, Turkey

sixth international
hydrail conference

- Why hybridise ?
- University of Pisa & Hybrid Technologies
- Economics of Hybridisation
- **Towards Hydrail**

1-2 July 2010 | Istanbul, Turkey

sixth international
hydrail conference

How to kickstart Hydrail ?

- Costly FC-based generation system (approx 5000 €/ kW vs. 50 \$/kW for ICEs)
- FC stack life is still well behind that of ICEs
- Some technical issues still to be solved (low temp storage, system reliability etc.)
- Inadequate hydrogen production & infrastructure
- Too many standards and regulations

So what can we do *today*?

- Build prototypes and demonstrators
- Make people realise that it's a *safe* technology
- Adopt technologies that can be adapted to hydrail later, with the minimal inputs
- This could be possible by adopting *hybrid* propulsion

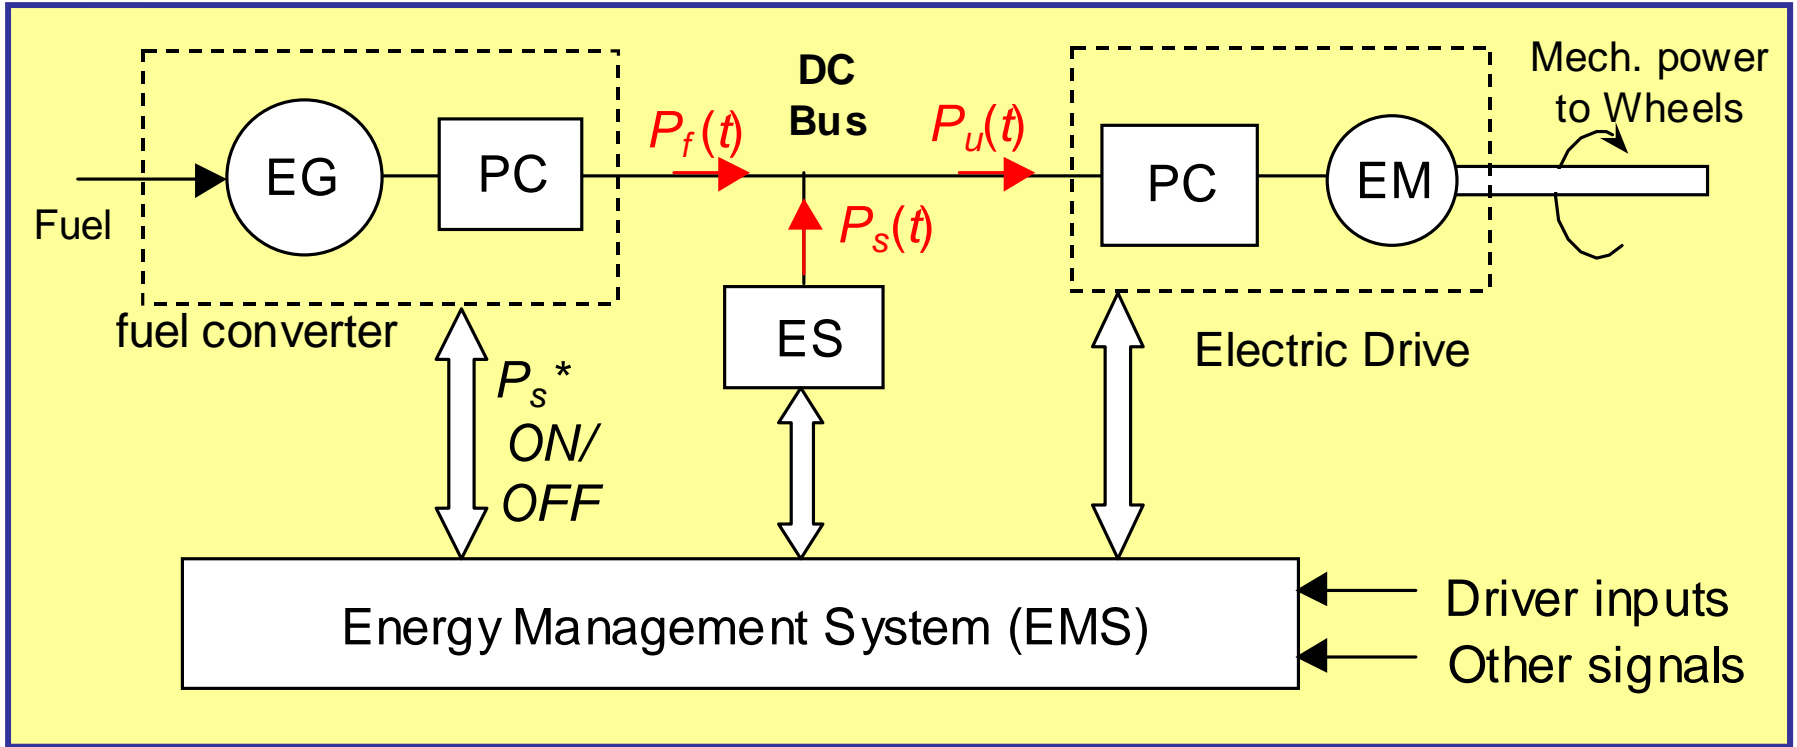

1-2 July 2010 | Istanbul, Turkey

sixth international
hydrail conference

Series-hybrid trains

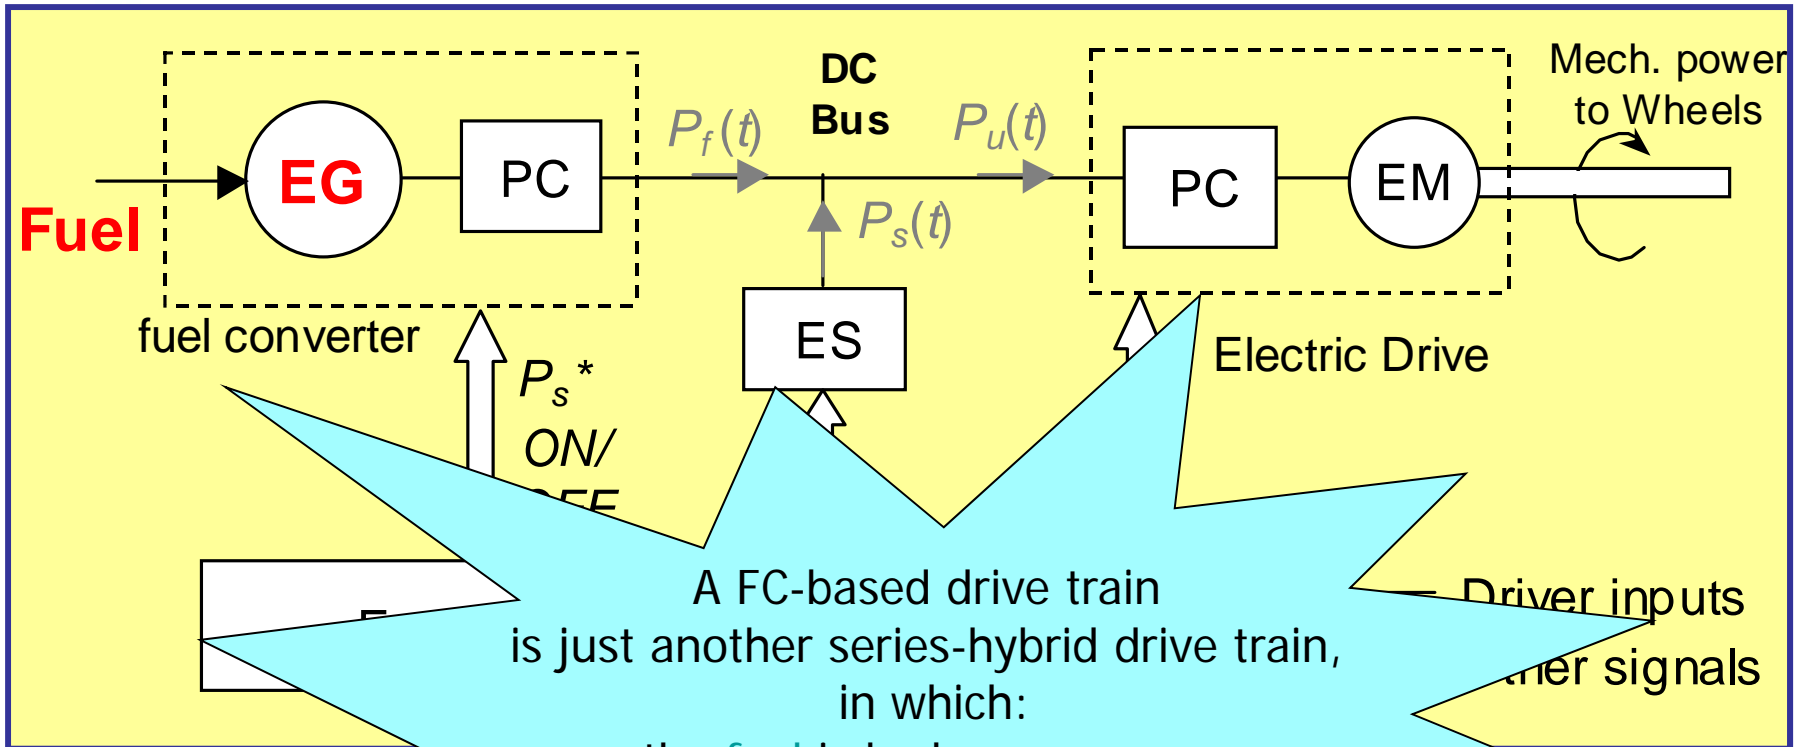

1-2 July 2010 | Istanbul, Turkey

sixth international
hydrail conference

A FC-based drive train

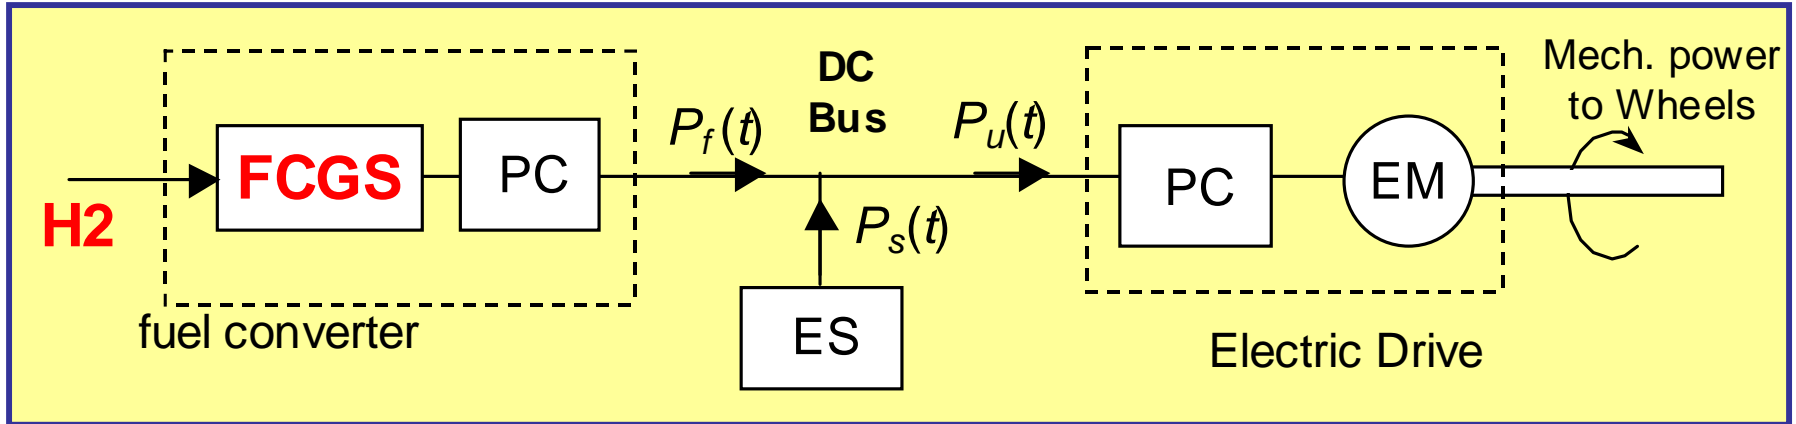

A FC-based drive train is just another series-hybrid drive train, in which:

- the **fuel** is hydrogen
- the **EG** is based on fuel-cells

Pure FC-based propulsion or hybrid solution?

Pure FC-loco

- Avoids additional cost & weight of energy storage

Hybrid FC-loco solution

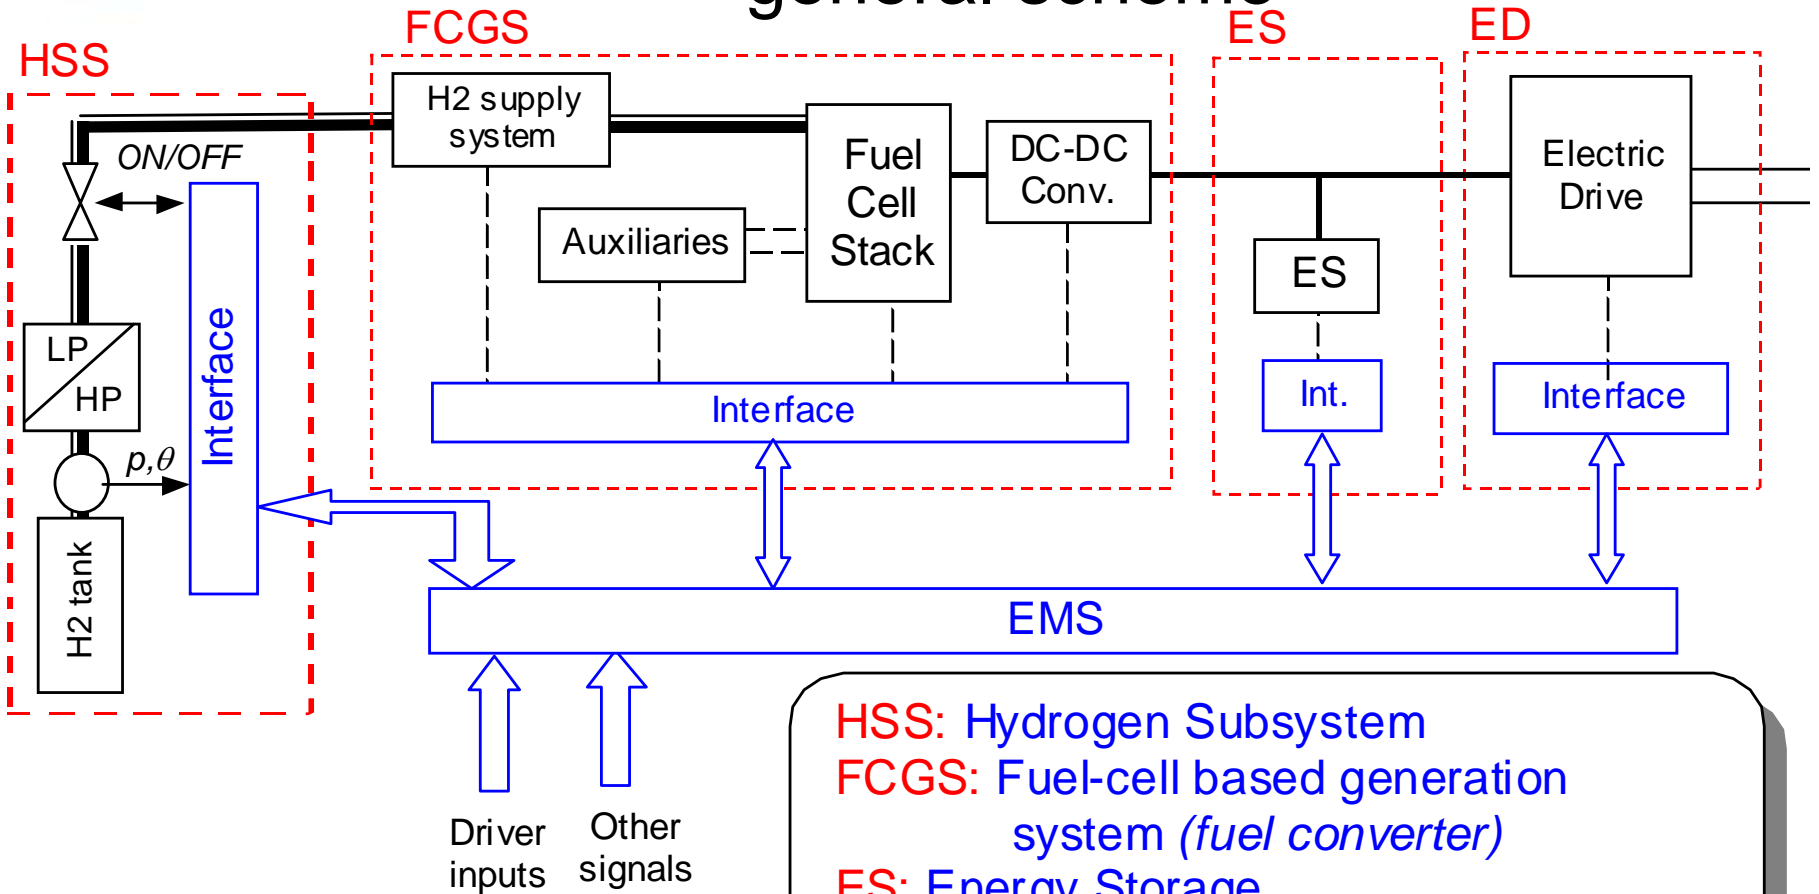

- Reduced size of FC (reduction increases with variation in duty cycle)
- Lower costs, higher life

Hybridisation works better when the duty cycles and load fluctuates more: best solution for suburban or intercity trains or shunters.

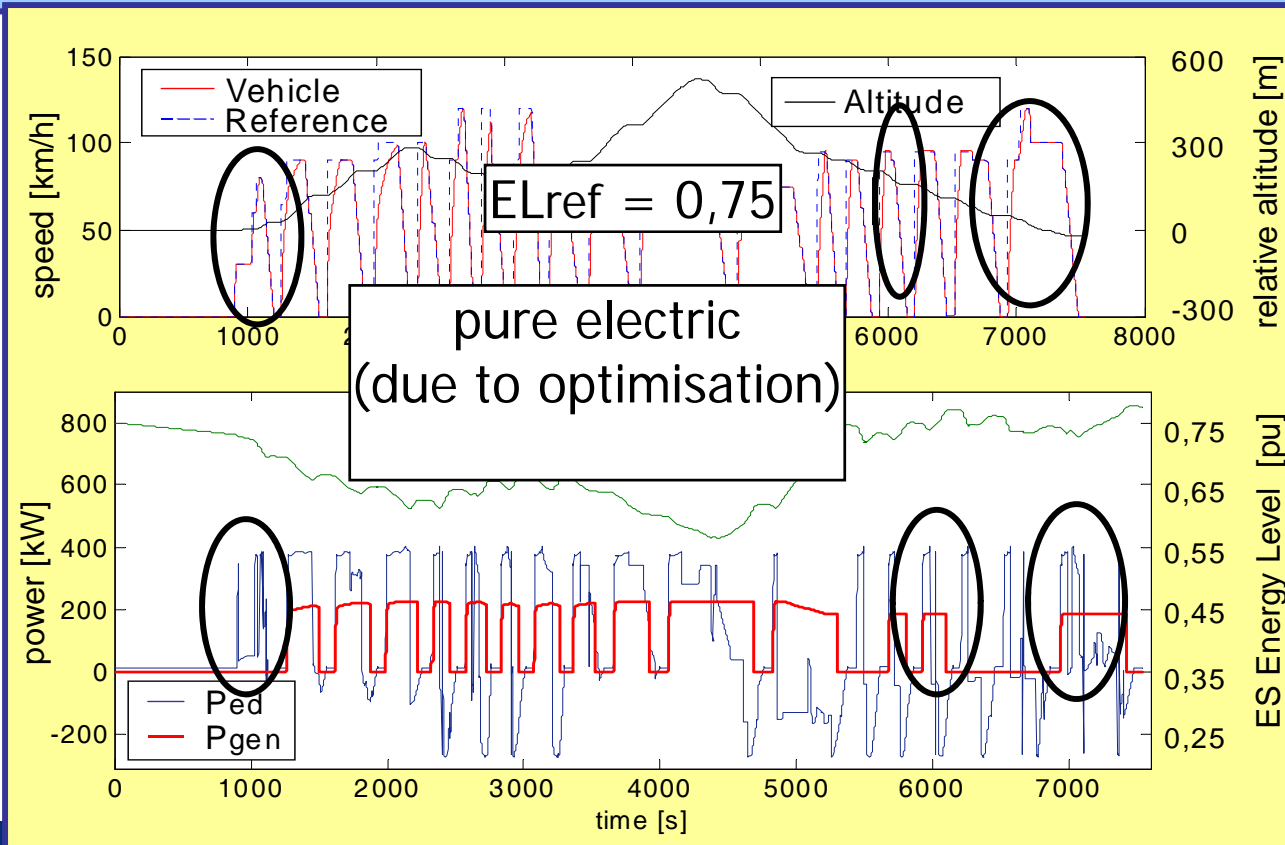

Hydrogen Fuel-cell based propulsion general scheme

Electro-mechanical hybrid trains may be already competitive (1)

Track FAENTINA (Firenze-Faenza) 100km – 17 intermediate stops
Comparison of Hybrid and conventional vehicles in terms of consumption and emissions

July 2010, Istanbul, Turkey

“Vettore Idrogeno” Project: FC-based Vehicle – Preliminary layout

3) FC-based hydrogen Locomotive (study)

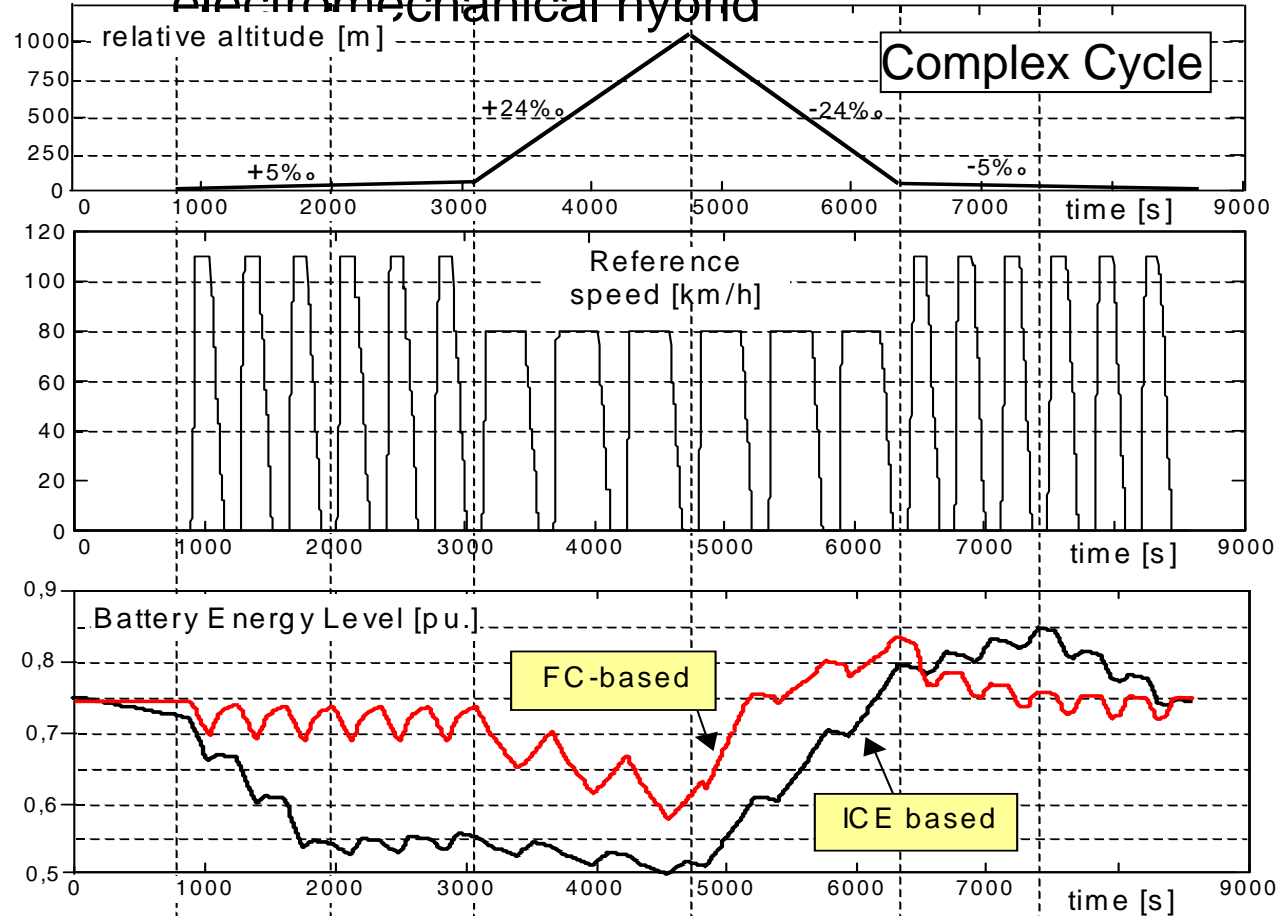

2 – Performance analysis in comparison with

electromechanical hybrid

Simulation Results
(auxiliaries enclosed)

| ICE-based | [kg/km] |
|------------------|-------------|
| Fuel Consumption | 0.48 |
| CO ₂ | 1.5 |
| | [g/km] |
| NO _x | 10.8 |
| HC | 0.02 |
| CO | 0.3 |
| PM | 0.02 |

| FC-based | [kg/km] |
|------------------|-------------|
| Fuel Consumption | 0.18 |

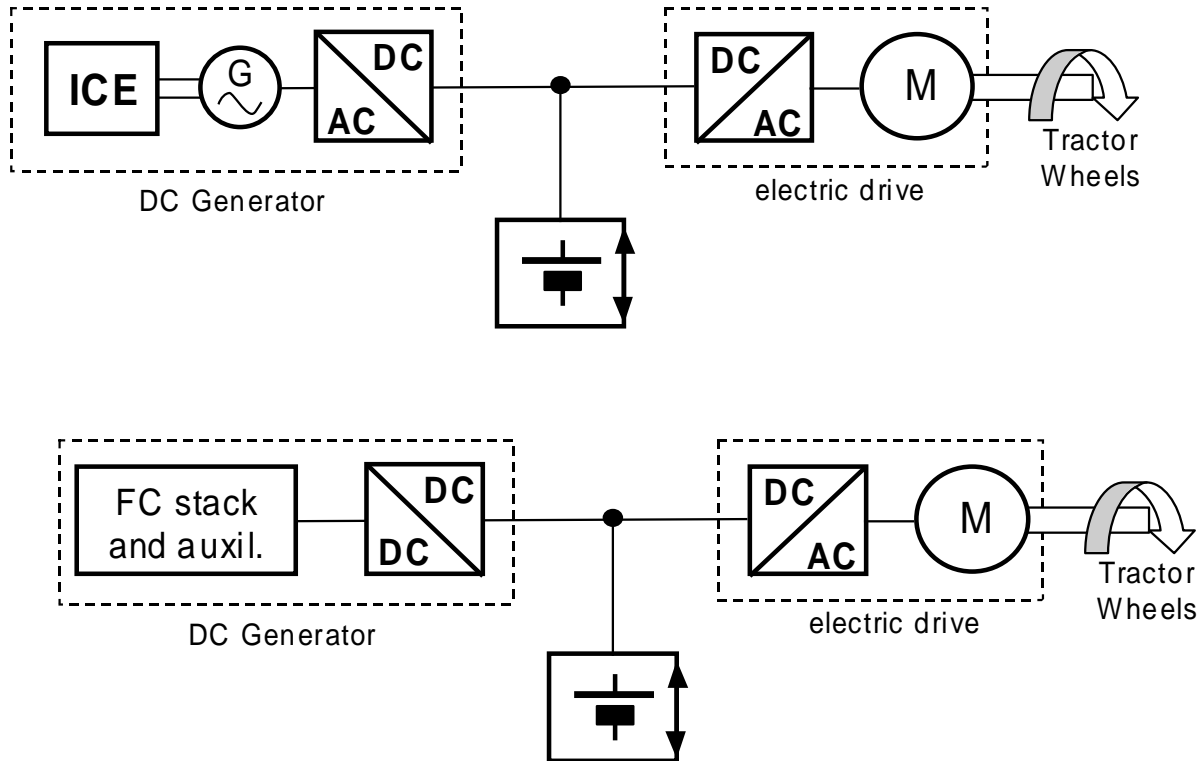

Cycle step: E H H H H E
 1-2 July 2010 | Istanbul, Turkey
 E = pure electric mode (only for the ICE-based)
 H = hybrid mode

Hydrogen Fuel-cell based propulsion

An *evolutionary* approach

Introduction of Hybrid propulsion in railway may:

- give immediate advantages in terms of fuel consumption
- give some zero-emission range
- *pave the way towards FC-based hybrid propulsion*
